

Make your file print-ready

1 Set up your file for standard production

We recommend using our templates, but you can also set up your document size according to the format you have chosen and adding **10 mm bleed**, as for the quality **150 dpi resolution** is the standard to ensure sharp and clear prints.

↑ 10 mm

Bleed

This area will be trimmed. Ensure all background graphics or images extend into this area.

Trim Line

This line is the trim size. Eyelets will be placed in the blue border. Do not place any important content in this area.

↑ 40 mm

Safety Margin

The grey line indicates the safe margin. Keep important text outside this area to avoid the eyelet zone.

2 Custom Size

If you need a custom format, please **be sure to include the bleed area** in your desired size. For instance, a custom format of 1500 x 2000 mm has a required bleed area of 10 mm on each side. Therefore your design size must be 1520 x 2020 mm.

3 Extra checks

Before exporting your artwork, ensure the following checks:

- We recommend a margin of 120 mm if you require tunnels. The size of the tunnel flat is 8 cm.
- **Check the amount of pages** in your document, it should be the same as your order. If your file has multiple pages, we cannot guarantee the accuracy of the print.
- All fonts and objects must be **embedded**
- Check your layers for **overprint**

4 Export to PDF

Export your artwork to PDF format and make sure your document **colour mode** is CMYK. All files in RGB will be automatically converted to CMYK.
